Multi-Platform Product Review Sentiment Analyzer

Problem Statement

Product reviews are scattered across platforms like Amazon and Flipkart, making them hard to analyze collectively. The large volume of reviews and lack of a unified sentiment summary make it difficult for users to quickly understand overall opinions and identify the best and worst feedback.

Objectives:

•To collect product reviews from multiple e-commerce platforms such as Amazon, Flipkart, etc., for a single product.

•To identify and extract the best (most positive) and worst (most negative) reviews for each product.

•To visualize sentiment distribution, ratings, and review insights using an interactive dashboard.

•To help users make informed purchasing decisions by providing a consolidated sentiment summary.
